

# Populate a list with a for loop

```
nums = [12, 8, 21, 3, 16]
new_nums = []
for num in nums:
    new_nums.append(num + 1)
print(new_nums)
```

```
[13, 9, 22, 4, 17]
```

# A list comprehension

```
nums = [12, 8, 21, 3, 16]  
new_nums = [num + 1 for num in nums]  
print(new_nums)
```

```
[13, 9, 22, 4, 17]
```

# For loop and list comprehension syntax

```
new_nums = [num + 1 for num in nums]
```

```
for num in nums:  
    new_nums.append(num + 1)  
print(new_nums)
```

```
[13, 9, 22, 4, 17]
```

# List comprehension with range()

```
result = [num for num in range(11)]  
print(result)
```

```
[0, 1, 2, 3, 4, 5, 6, 7, 8, 9, 10]
```

# List comprehensions

- Collapse for loops for building lists into a single line
- Components
  - Iterable
  - Iterator variable (represent members of iterable)
  - Output expression

# Nested loops (1)

```
pairs_1 = []  
for num1 in range(0, 2):  
    for num2 in range(6, 8):  
        pairs_1.append(num1, num2)  
print(pairs_1)
```

```
[(0, 6), (0, 7), (1, 6), (1, 7)]
```

- How to do this with a list comprehension?

# Nested loops (2)

```
pairs_2 = [(num1, num2) for num1 in range(0, 2) for num2 in range(6, 8)]  
print(pairs_2)
```

```
[(0, 6), (0, 7), (1, 6), (1, 7)]
```

- Tradeoff: readability

# Let's practice!

PYTHON DATA SCIENCE TOOLBOX (PART 2)

# Conditionals in comprehensions

- Conditionals on the iterable

```
[num ** 2 for num in range(10) if num % 2 == 0]
```

```
[0, 4, 16, 36, 64]
```

- Python documentation on the `%` operator: The `%` (modulo) operator yields the remainder from the division of the first argument by the second.

```
5 % 2
```

```
1
```

```
6 % 2
```

```
0
```

# Conditionals in comprehensions

- Conditionals on the output expression

```
[num ** 2 if num % 2 == 0 else 0 for num in range(10)]
```

```
[0, 0, 4, 0, 16, 0, 36, 0, 64, 0]
```

# Dict comprehensions

- Create dictionaries
- Use curly braces `{}` instead of brackets `[]`

```
pos_neg = {num: -num for num in range(9)}  
print(pos_neg)
```

```
{0: 0, 1: -1, 2: -2, 3: -3, 4: -4, 5: -5, 6: -6, 7: -7, 8: -8}
```

```
print(type(pos_neg))
```

```
<class 'dict'>
```

# Let's practice!

PYTHON DATA SCIENCE TOOLBOX (PART 2)

# Generator expressions

- Recall list comprehension

```
[2 * num for num in range(10)]
```

```
[0, 2, 4, 6, 8, 10, 12, 14, 16, 18]
```

- Use `()` instead of `[]`

```
(2 * num for num in range(10))
```

```
<generator object <genexpr> at 0x1046bf888>
```

# List comprehensions vs. generators

- List comprehension - returns a list
  - Generators - returns a generator object
  - Both can be iterated over
- The generator yields one item at a time and generates item only when in demand.
  - Whereas, in a list comprehension, Python reserves memory for the whole list.
  - Thus we can say that the generator expressions are memory efficient than the lists

# Printing values from generators (1)

```
result = (num for num in range(6))  
for num in result:  
    print(num)
```

```
0  
1  
2  
3  
4  
5
```

```
result = (num for num in range(6))  
print(list(result))
```

```
[0, 1, 2, 3, 4, 5]
```

# Printing values from generators (2)

```
result = (num for num in range(6))
```

- Lazy evaluation

```
print(next(result))
```

0

```
print(next(result))
```

1

```
print(next(result))
```

2

```
print(next(result))
```

3

```
print(next(result))
```

4
