Categorical Data

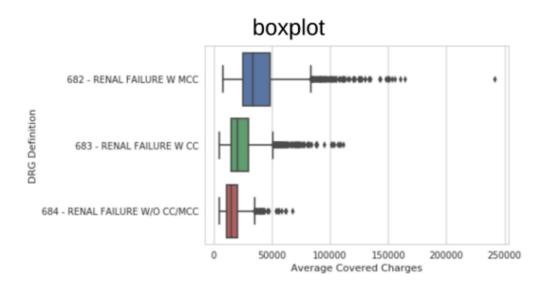

- Data which takes on a limited and fixed number of values
- Normally combined with numeric data
- Examples include:
 - Geography (country, state, region)
 - Gender
 - Ethnicity
 - Blood type
 - Eye color

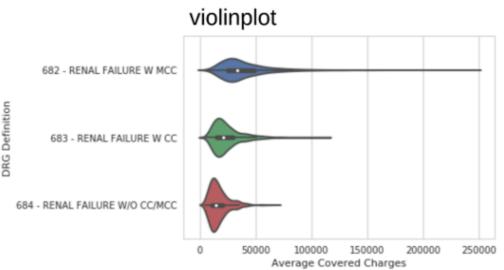

Plot types - show each observation

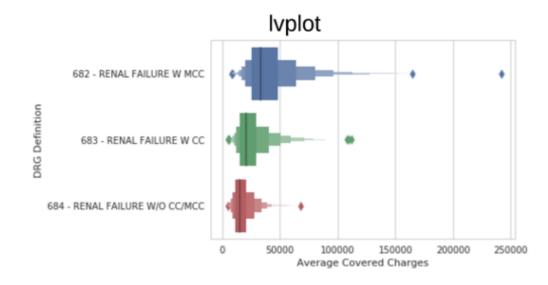

Plot types - abstract representations

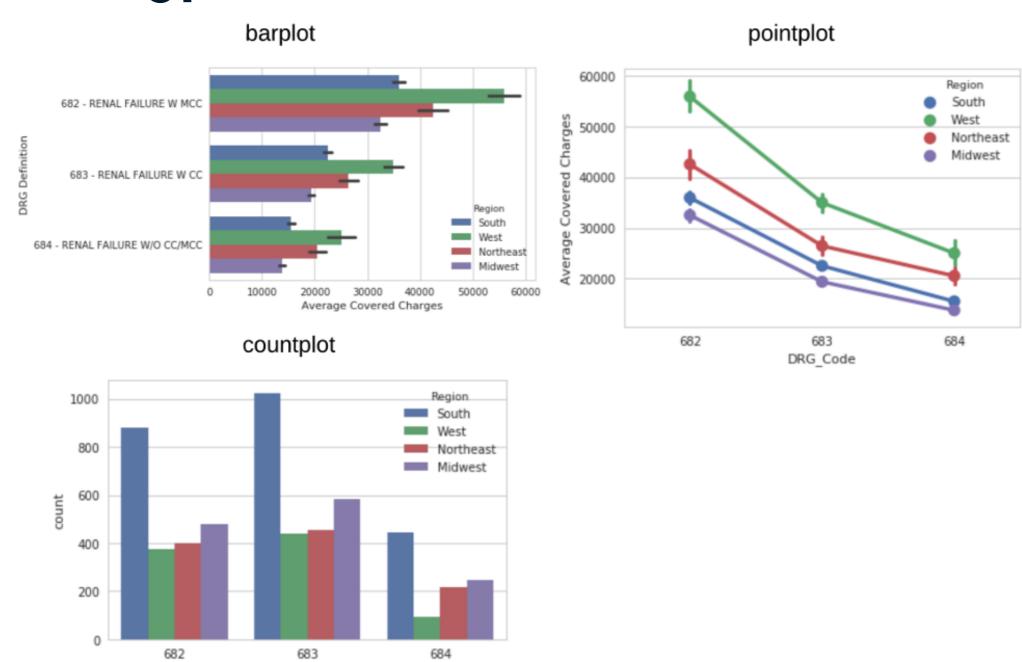

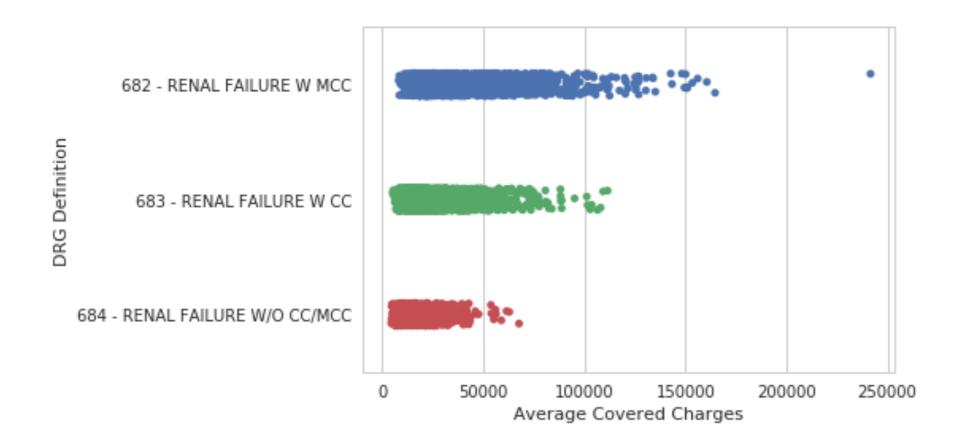

Plot types - statistical estimates

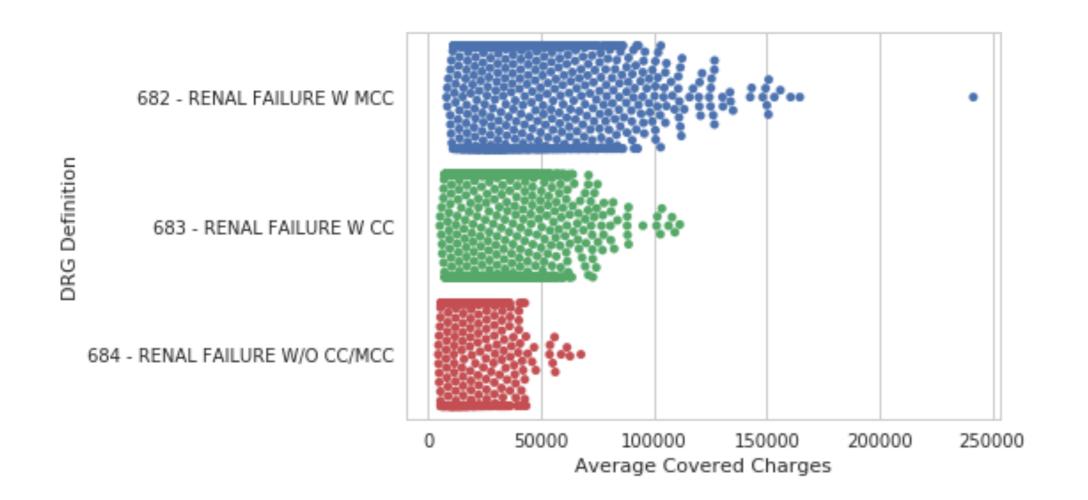

DRG Code

Plots of each observation - stripplot

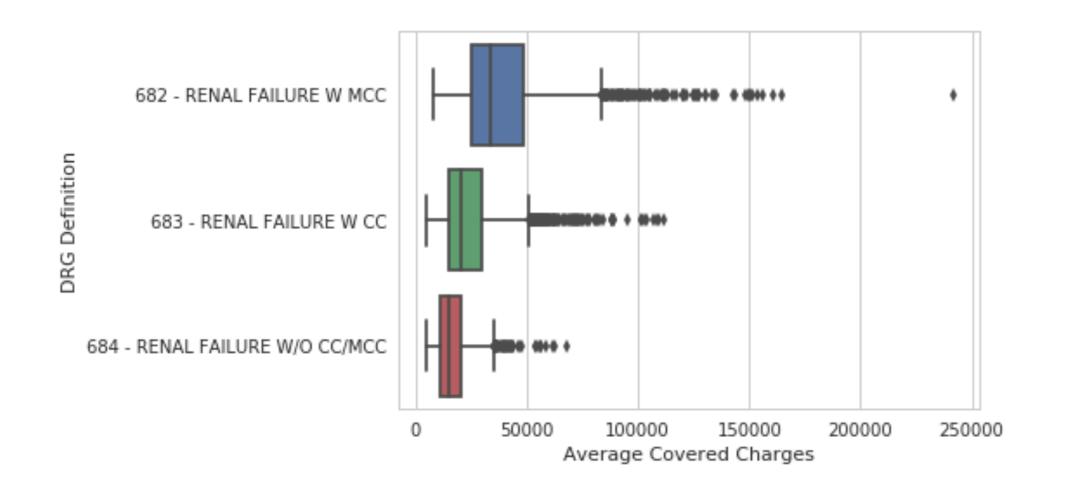

Plots of each observation - swarmplot

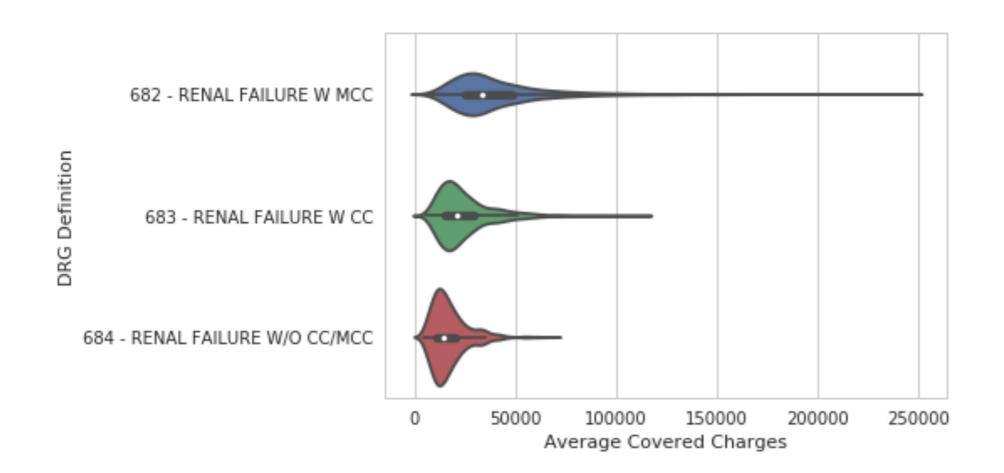

Abstract representations - boxplot

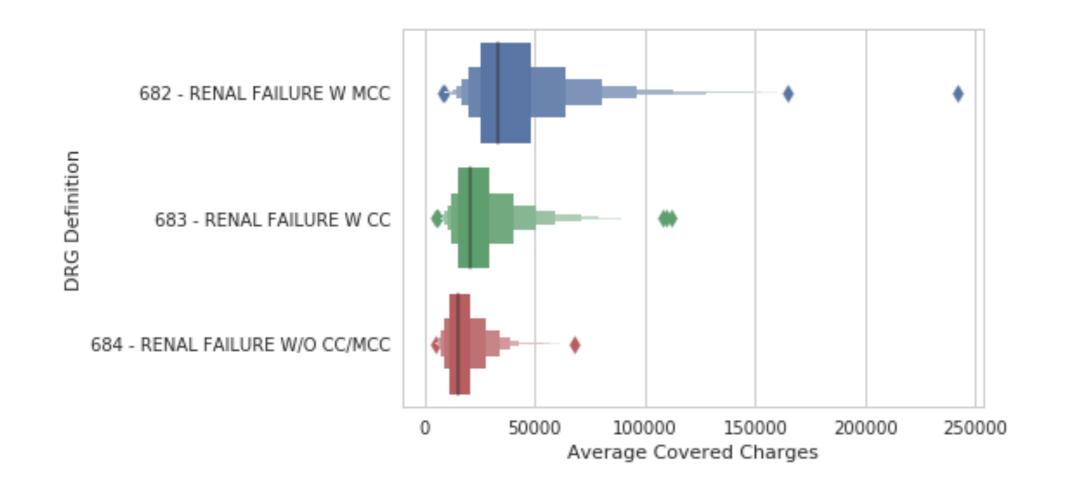

Abstract representation - violinplot

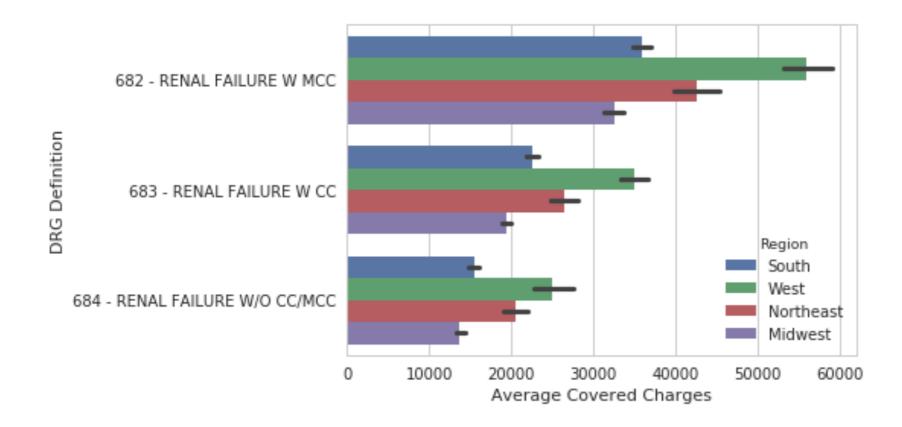

Abstract representation - lvplot

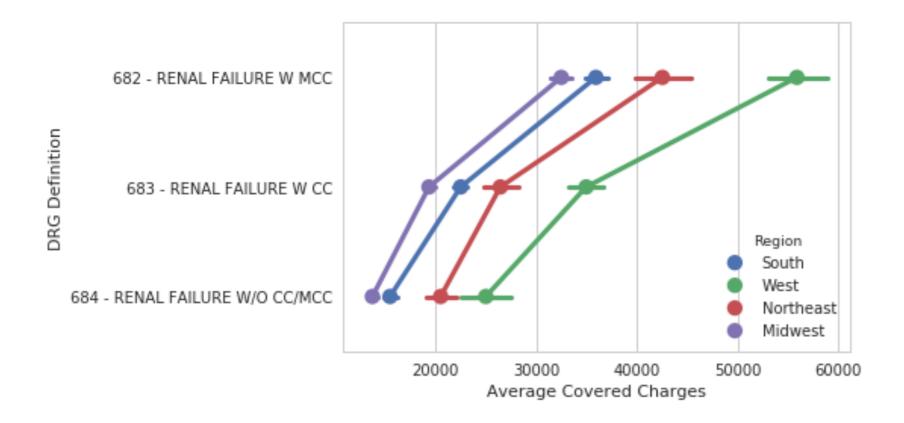

Statistical estimates - barplot

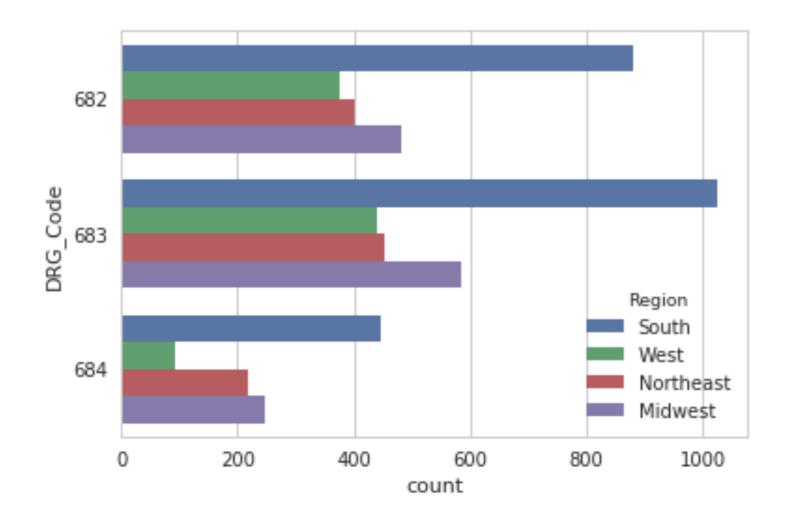

Statistical estimates - pointplot

Statistical estimates - countplot

sns.countplot(data=df, y="DRG_Code", hue="Region")

Let's practice!

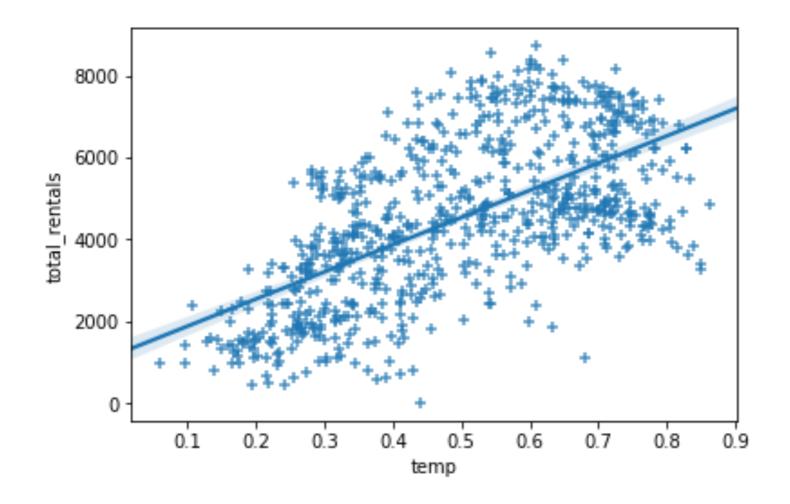

INTERMEDIATE DATA VISUALIZATION WITH SEABORN

Bicycle Dataset

- Aggregated bicycle sharing data in Washington DC
- Data includes:
 - Rental amounts
 - Weather information
 - Calendar information
- Can we predict rental amounts?

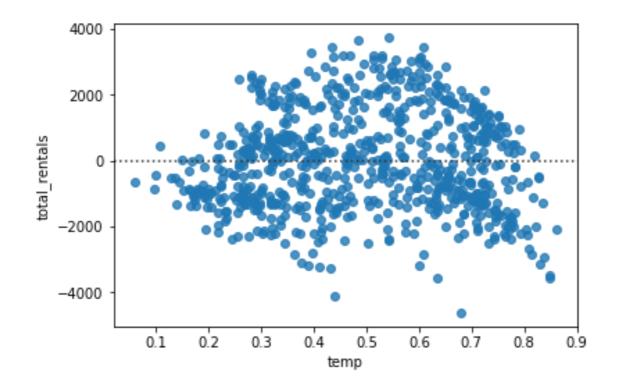

Plotting with regplot()

Evaluating regression with residplot()

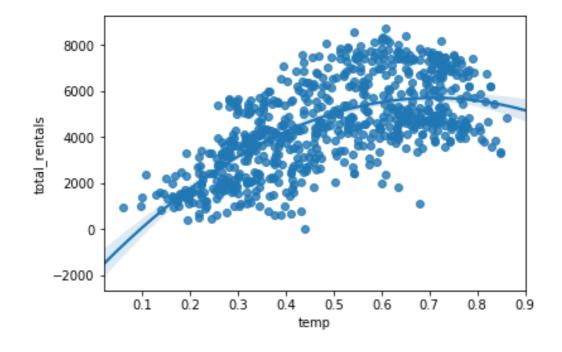

- A residual plot is useful for evaluating the fit of a model
- Seaborn supports through residplot function

```
sns.residplot(data=df, x='temp', y='total_rentals')
```

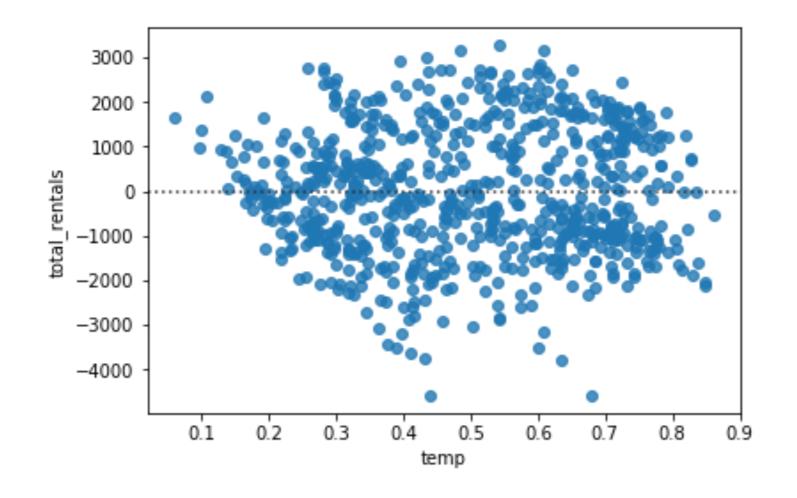

Polynomial regression

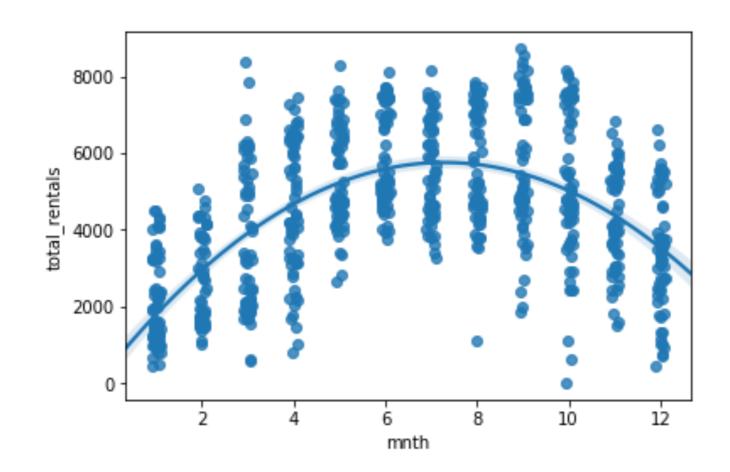

Seaborn supports polynomial regression using the order parameter

residplot with polynomial regression

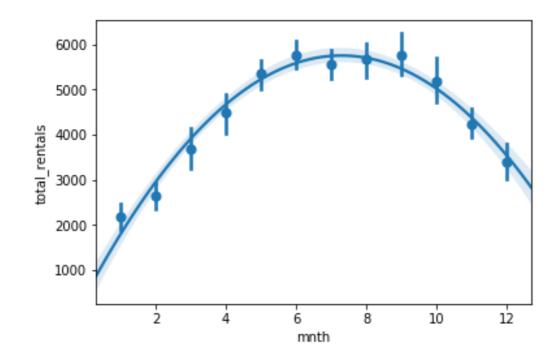

Categorical values

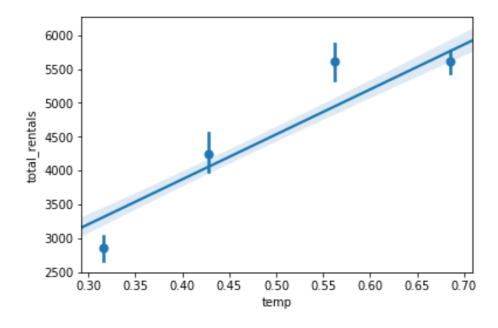

Estimators

• In some cases, an x_estimator can be useful for highlighting trends

Binning the data

- x_bins can be used to divide the data into discrete bins
- The regression line is still fit against all the data

Let's practice!

INTERMEDIATE DATA VISUALIZATION WITH SEABORN

Getting data in the right format

- Seaborn's heatmap() function requires data to be in a grid format
- pandas crosstab() is frequently used to manipulate the data

```
pd.crosstab(df["mnth"], df["weekday"],
values=df["total_rentals"],aggfunc='mean').round(0)
```

```
        mnth
        1
        2
        3
        4
        5

```

Plotting a correlation matrix

- Pandas corr function calculates correlations between columns in a dataframe
- The output can be converted to a heatmap with seaborn

sns.heatmap(df.corr())

Let's practice!
